

Module: Create Model-driven App for Device Request Management

Overview

In this module, you will create the Model-driven App recommended for the IT Administrator persona. This app provides administrative capabilities to view, approve, and manage device requests and device inventory. You will also integrate the previously created Copilot agent into the app via Agent Feed.

Learning Objectives

By the end of this module, you will: - Activate and generate the proposed Model-driven App. - Review automatically generated pages aligned to requirements. - Add the Copilot agent to the app via Agent Feed. - Publish the app for use in testing and end-to-end scenarios.

Prerequisites

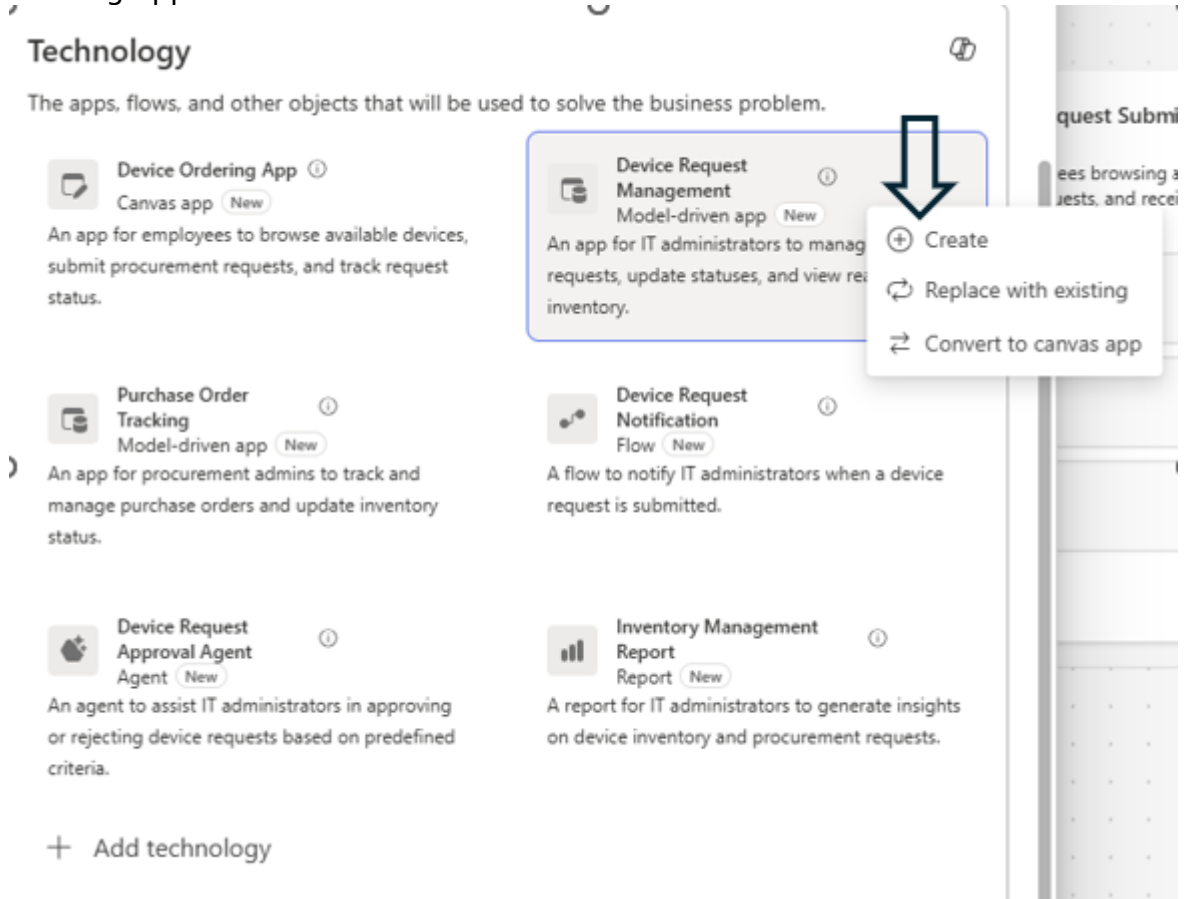

- Completion of Copilot Agent module.
- Dataverse tables (Device Requests, Device) saved and available.
- Plan Designer recommendations saved through Solutions Agent.
- Access to <https://make.powerapps.com> with appropriate environment selected.

Create Model-driven App

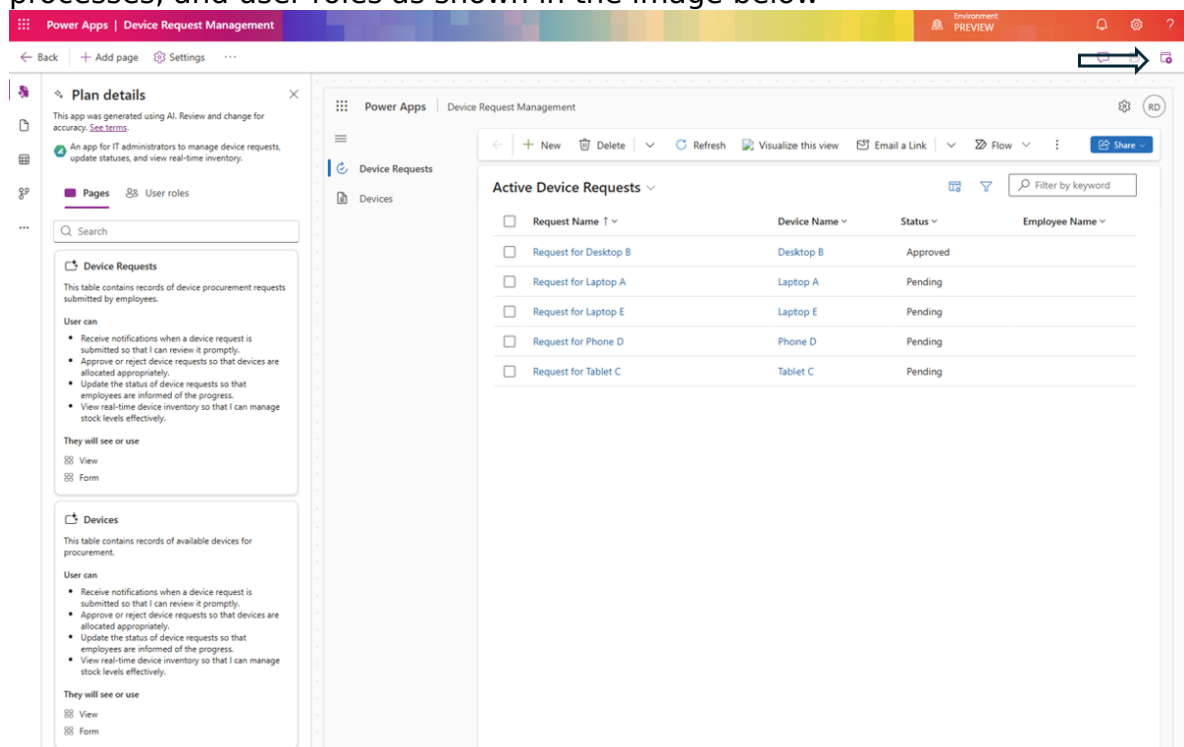

The Device Request Management app for IT Admins is recommended as a Model-driven Power App.

- 1 . To create the Model-driven App, click **Create**. This will open a new tab and initiate the app creation process.
This Model-driven App is designed for the **“IT Administrator”** user persona. It allows users to view and update device requests and monitor device inventory.
 **Note:** You have full flexibility to choose the type of app you want to make available for your user personas. You can also convert app types and bring your

existing apps to the forefront.

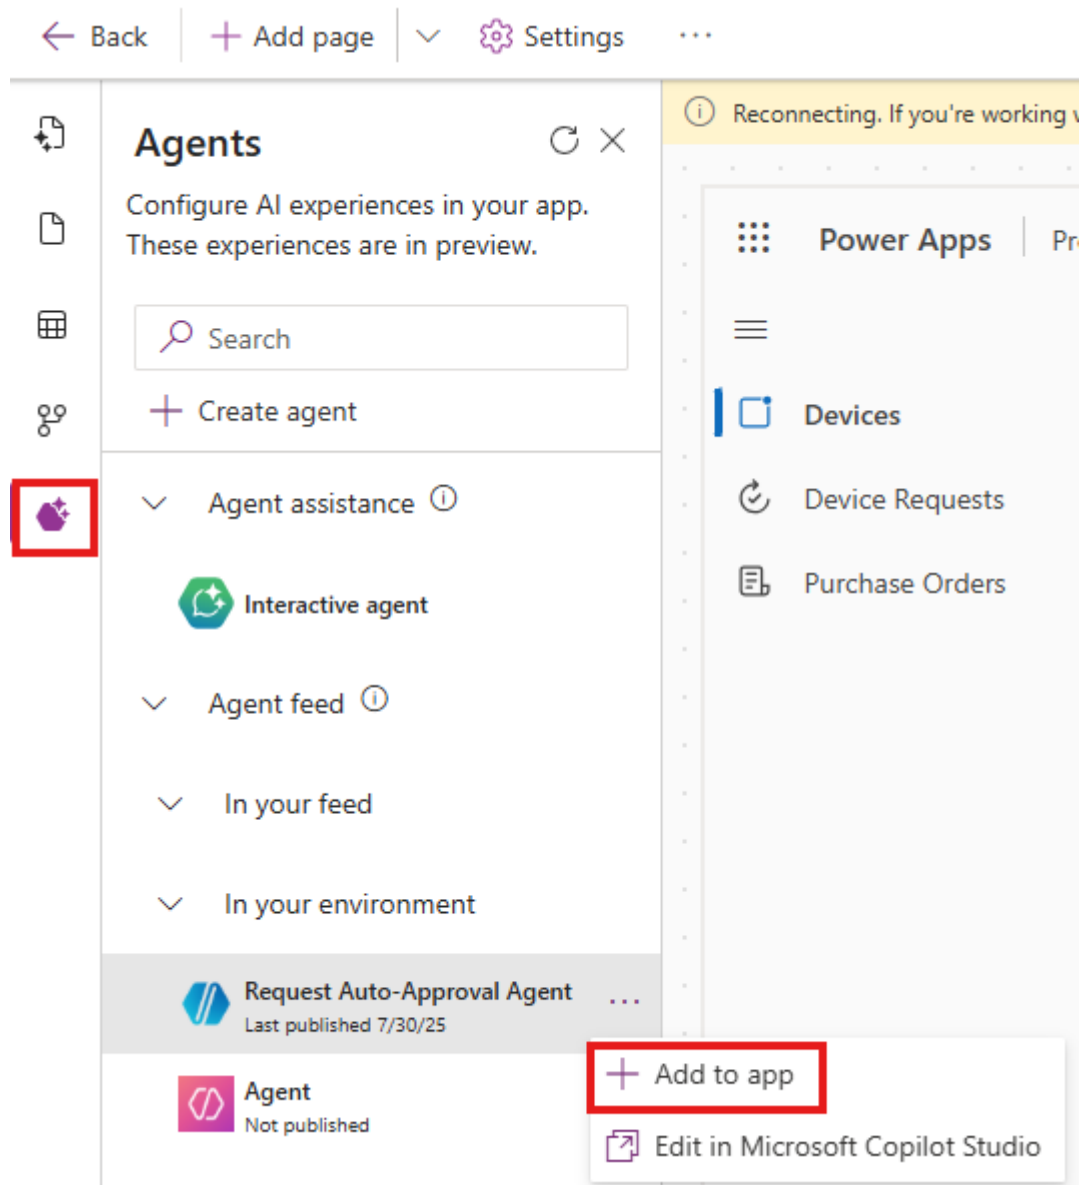

2. The two generated pages align with the defined business requirements, processes, and user roles as shown in the image below

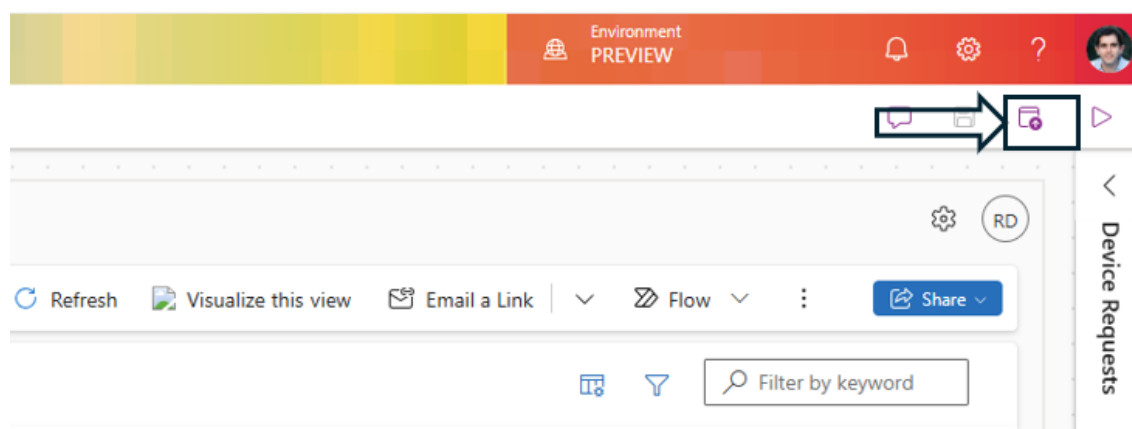

3. Now we will add Agent Feed to the App
In the left nav, click on the Agents button.
Your created agent shows up under the "In your environment" section.

Click on the ellipsis next to the agent and select **“Add to app”**.

This agent is now part of the model driven app's Agent Feed.

- 1 . Next, click **Publish this app**, and once published, close your browser tab.

- 2 . Back in the Plan Designer, you will note that both the **Canvas App** and the **Model-driven App** have been activated.

Technology

The apps, flows, and other objects that will be used to solve the business problem.

**Device Ordering Canvas App** ⓘ
Canvas app
An app for employees to browse available devices, submit procurement requests, and track request statuses.

**Purchase Order Tracking** ⓘ
Model-driven app **New**
An app for procurement admins to track the status of purchase orders and mark them as completed.

**Request Approval Notification** ⓘ
Flow **New**
A flow to notify employees when their device request is approved or rejected.

**Inventory Management Report** ⓘ
Report **New**
A report for IT administrators to track device inventory and generate insights on stock levels.

**Device Request Management** ⓘ ... 
Model-driven app
An app for IT administrators to manage device requests, approve or reject them, and track inventory.

**Device Request Notification** ⓘ
Flow **New**
A flow to notify IT administrators when a device request is submitted.

**Purchase Order Generation** ⓘ
Flow **New**
A flow to automatically generate a purchase order request when a device request is approved.

**Device Request Approval Agent** ⓘ
Agent **New**
An agent to assist IT administrators in reviewing and approving device requests efficiently.

+ Add technology

Recommended Next Step

Proceed to the Cloud Flows module to automate notifications and other processes supporting the solution.
