

The power of the platform

Empower **everyone** who needs to create
business software.

Your solutions,
your way
Now, **augmented**

**All deployed on
an enterprise
ready platform.**

**Managed
security**

Advanced
protection for an
AI-driven world

**Managed
governance**

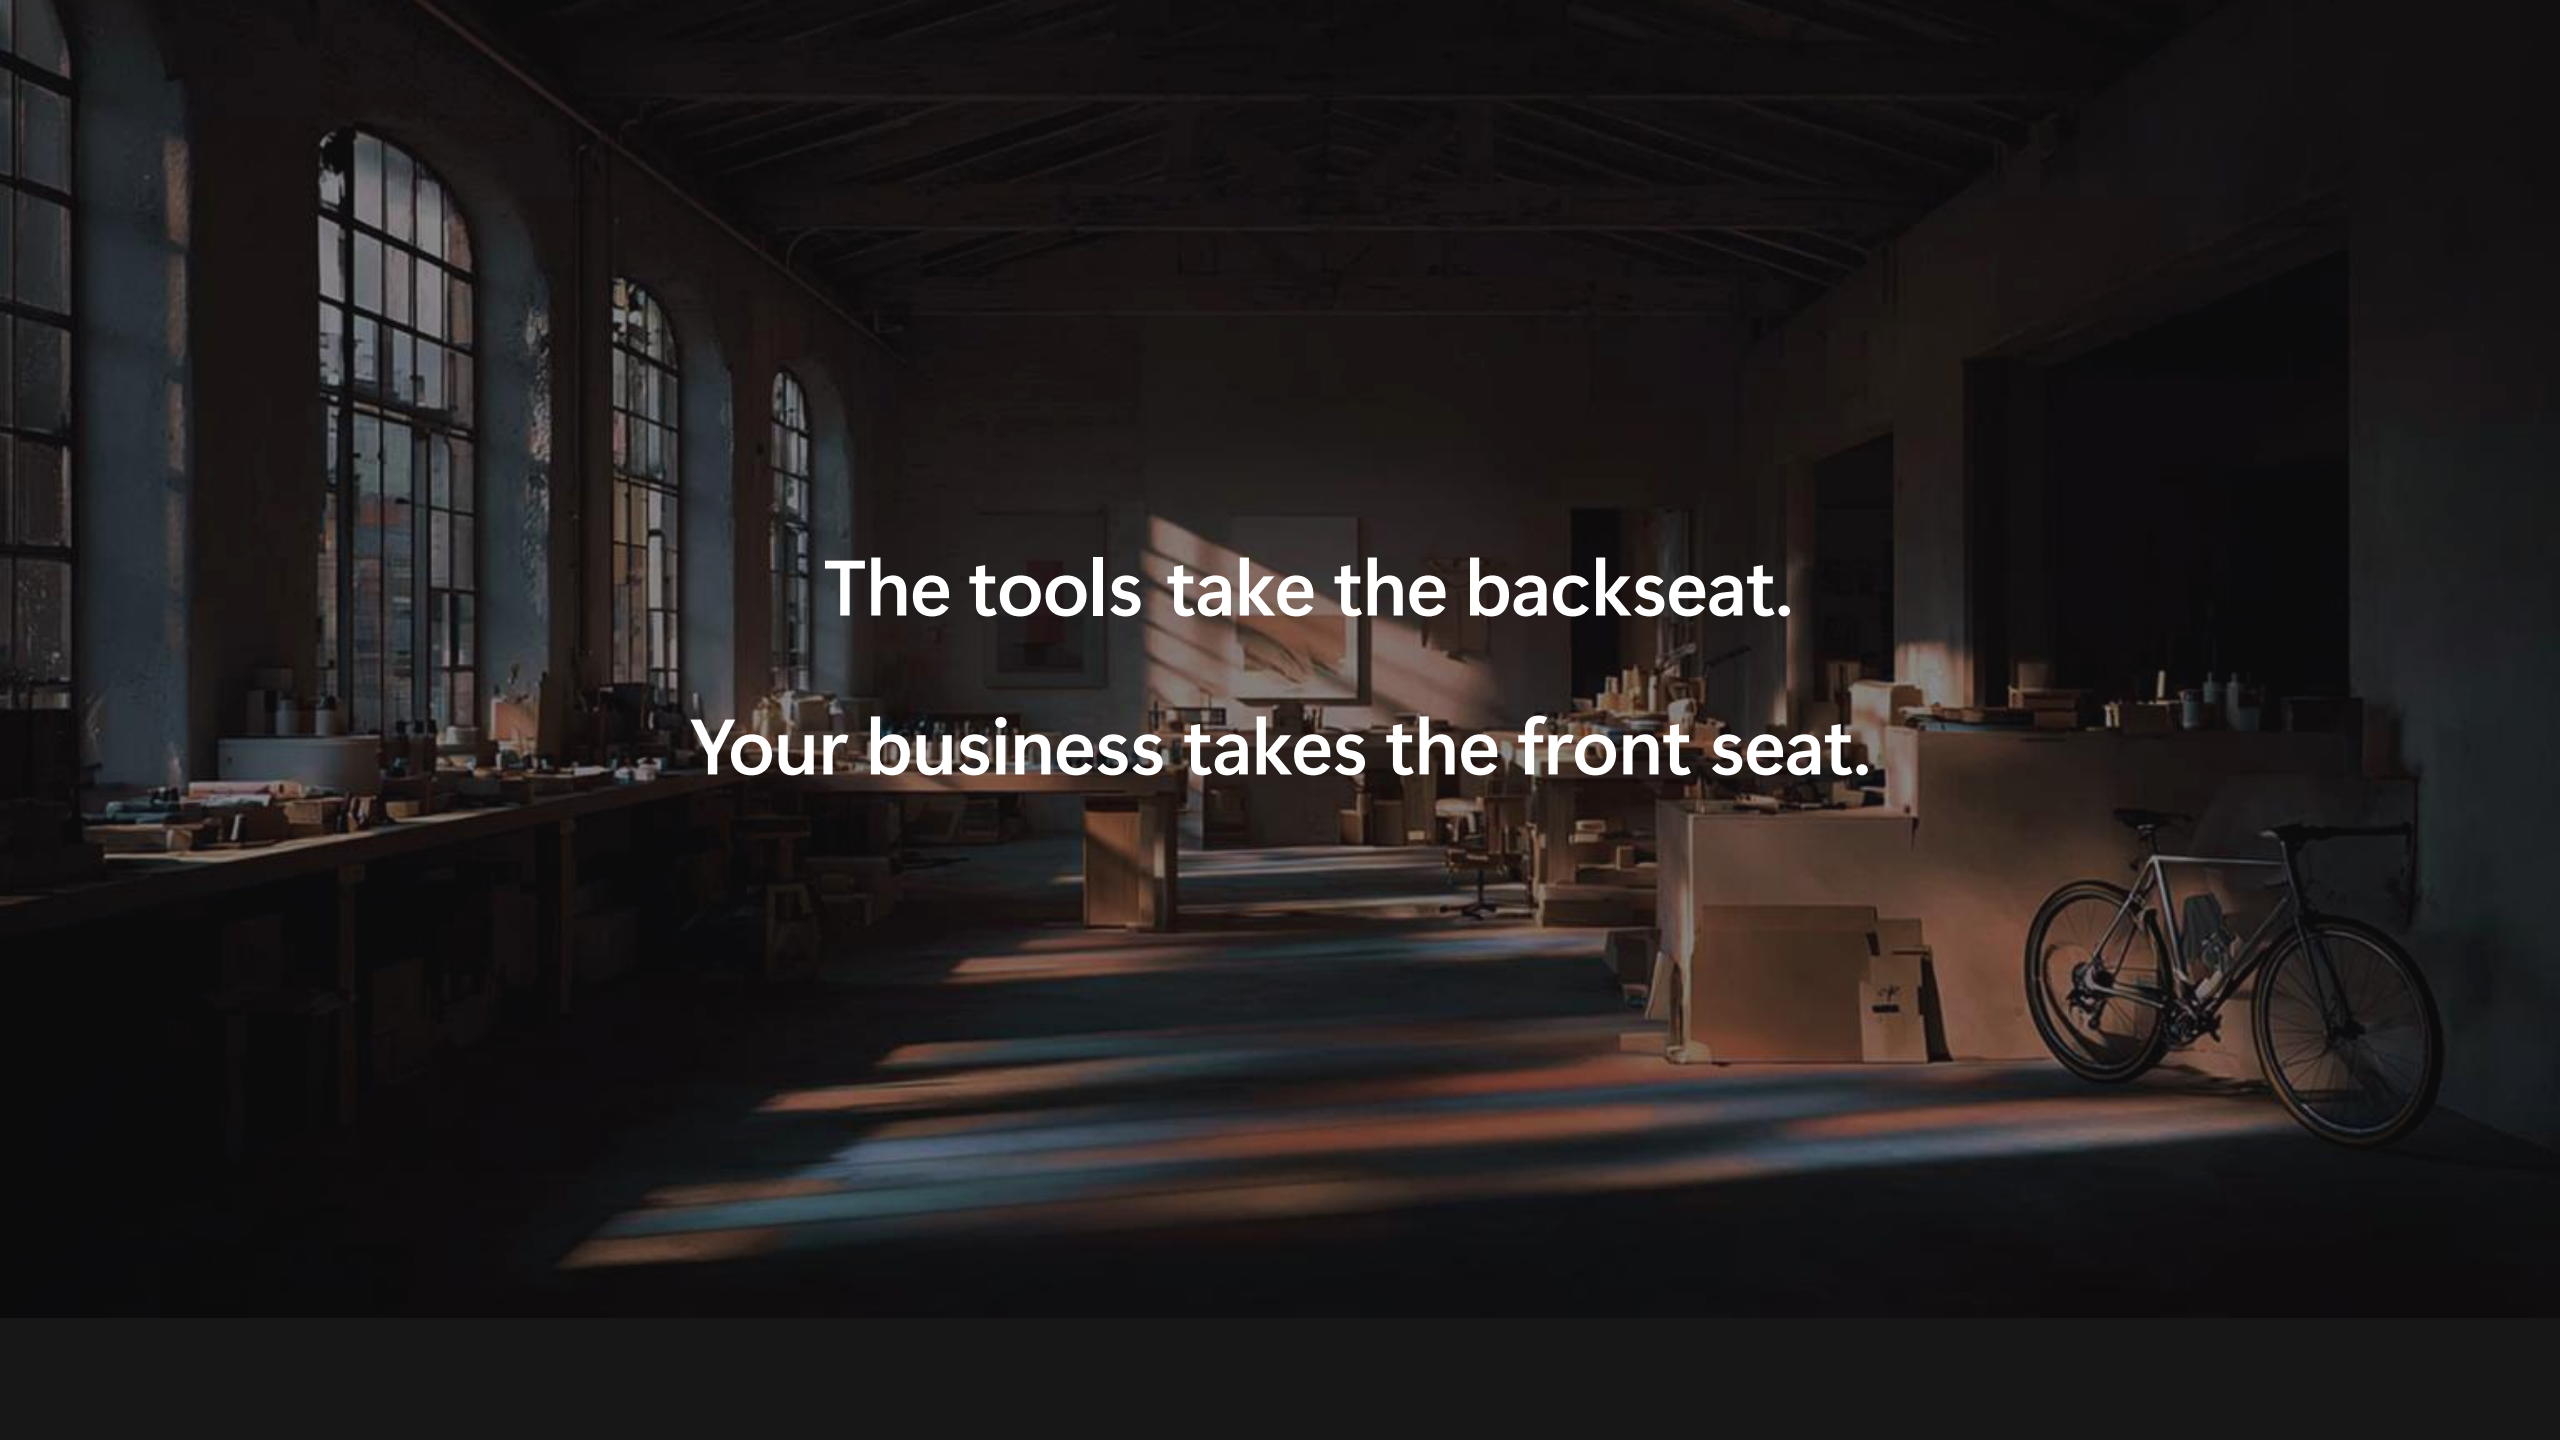

More visibility,
more control,
less effort

**Managed
operations**

Operational
excellence for
agents at scale

**Managed
availability**

Enterprise-grade
reliability for mission
critical workloads

A dark, atmospheric photograph of a workshop or studio. The space is filled with workbenches, tools, and various items, suggesting a creative or industrial environment. Large arched windows on the left side allow natural light to stream in, creating strong shadows and highlights across the floor and work surfaces. A bicycle is parked on the right side of the frame. The overall mood is quiet and focused.

The tools take the backseat.
Your business takes the front seat.

Power Series Labs

Automation Foundations – Computer Use Agent

The Power Series

One Catalog. Five Tracks. Endless Possibilities.

Let your business need shape the solution.

The Power Series gets you hands-on with every Power Platform capability, so you design the right solution for any business process – one or more apps, automations and agents, working together on a governed foundation. Run a track end to end, or pick the modules that fit your scenario, audience and skill level.

Digitize Internal Operations

Replace manual work with focused apps and connected data

Automate workflows and processes

Reduce repetitive work with automation, approvals, and AI

Improve customer interactions

Create secure experiences for customers, partners and communities

Modernize existing applications

Evolve legacy solutions with modern apps, automation, and AI

Strengthen governance and security

Apply guardrails, visibility, and control across the platform

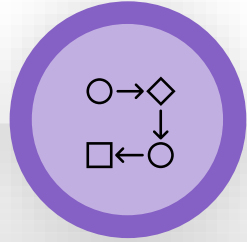

The Power Series

Lab: Automation Foundations – Computer Use Agent

- Create a Copilot Studio agent with generative orchestration.
- Add a computer use tool and describe its task in plain language.
- Automate a form whose fields keep moving — matching them by label with vision, instead of by position.

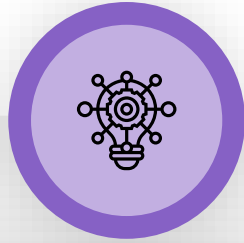

The Modern Automation Spectrum

From structured, deterministic workflows to adaptive, agentic automations

Rule-Based Automation

*Automations that follow **rigid, predetermined rules**, executing actions based on predefined triggers.*

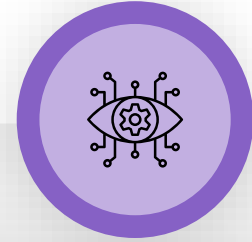

AI-Enhanced Automation

*Step-by-step automations infused with **AI-powered actions** to handle more complex scenarios and make basic decisions.*

Agentic Automation

*Automations that combine AI models with natural language understanding to **plan, reason, adapt, and orchestrate workflows***

Autonomous Agentic Automation

*Agents **autonomously interpret goals, plan tasks, and learn** from experience, with a varying level of human oversight*

Structured

Adaptive

Power Automate

Copilot Studio

Autonomous Agentic Automation

Autonomous agents are:

- **Independent** – they run autonomously, with minimal human intervention
- **Goal-driven** – they work towards outcomes, rather than following step-by-step instructions
- **Context-aware** – they adjust workflow execution based on environmental signals, observed results, and learnings

Autonomous agentic automations independently decide, act, and learn in pursuit of a goal

Computer Using Agents (CUA) in Copilot Studio

Agents can interact with websites and desktop apps via the UI, similarly to RPA

Add a Computer use tool to your agent to seamlessly run UI Automation.

- ➔ CUA: AI model that combines vision capabilities with advanced reasoning to interact with graphical user interfaces
- ➔ Describe in natural language what you want computer use to do, and it performs the task on a computer
- ➔ Seamlessly **manage passwords** to login onto the machine, any website or application using a built-in credential store.

CUA and RPA

When to use each

Today, use RPA when

UI is stable

The screens, fields, and selectors hardly change

Rules are clear

Decisions can be captured in rules

Speed matters

High-volume where every second counts

An RPA team owns it

Existing RPA development and management knowledge

GA is a must

For mission critical systems

Today, use CUA when

UIs shift or vary widely

Multiple apps, frequent redesigns

Decisions are fuzzy

The agent must think to pick the next step or self-correct

Vision matters

The task depends on what's visible on screen (charts, colors, dynamic layouts)

RPA team can't take it

The RPA team's backlog is full.
Easier to build

Tolerance for errors

"Misclicks" or retries are ok.
E.g., read only scenarios

Use both where CUA covers RPA

Self-heal after a failure or step is too dynamic

Timer

60 mins
