

Export inventory to CSV

The filtered list answers your question, but others need the answer too: the departing maker's manager, the governance team, and the next audit. In this lab you export your filtered inventory as a CSV for offline analysis and sharing.

Step 1: Confirm your filters and columns

1. You should still be on the **Maker inventory** page with the filters from the previous lab applied — one environment, one owner, one time window. If you cleared them, reapply a filter or two; any filtered view works for this lab.
2. Confirm that **Last modified by** is visible in the table, and that the item count above the table matches the scoped-down list you expect to share.

Step 2: Download the CSV

1. On the command bar above the table, select the **Download** icon. In the **Download to .csv** dialog that appears, select **Download**.

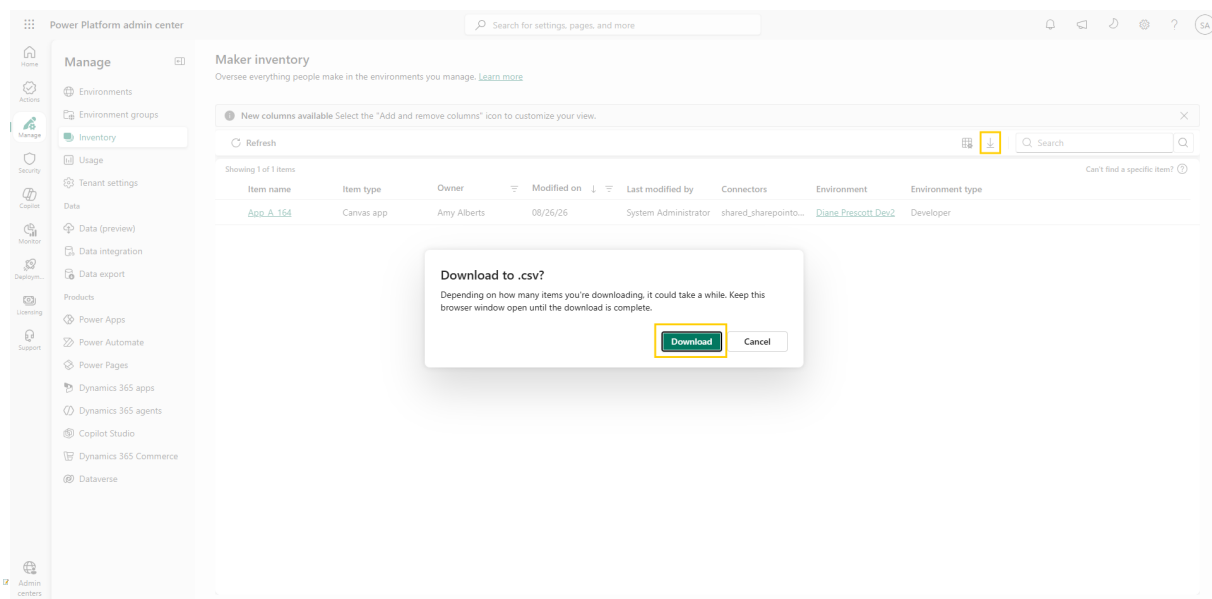

Figure: Download to .csv confirmation dialog.

2. An **Inventory.csv** file is saved to your local device.

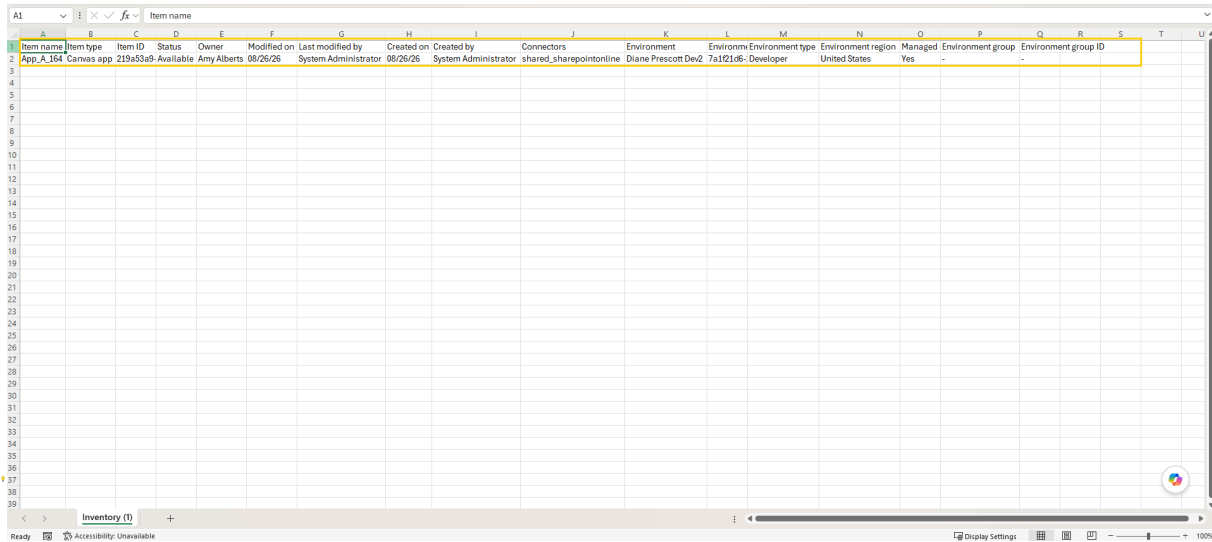

The export can take a while depending on how many items you're downloading — keep the browser window open until the download completes.

Step 3: Verify the export

1. Open the file in Excel (or another spreadsheet application).

2. Confirm that:

- The rows in the file match the filtered set you saw in the admin center.
- Columns such as **Item name**, **Item type**, **Owner**, **Environment**, and **Last modified by** are present.

Item name	Item type	Item ID	Status	Owner	Modified on	Last modified by	Created on	Created by	Connectors	Environment	Environment ID	Environment type	Environment region	Managed	Environment group	Environment group ID
App_A_164	Canvas app	219a3a93	Available	Amy Alberts	08/26/26	System Administrator	08/26/26	System Administrator	shared_sharepointonline	Diane Prescott Dev2	7a1f21d6	Developer	United States	Yes	-	-

Figure: Exported Inventory.csv file opened in Excel.

The CSV export includes all available columns, even those you hid in the admin center — your column visibility settings affect only the on-screen view, not the export.

The handover list now exists as a file that can be reviewed, archived, and compared against a future export.
