

Review triggered and predefined alerts

Your custom rule evaluates daily, and Microsoft's predefined rules watch your high-use resources tenant-wide. In this final lab you review where their output appears: the Triggered alerts tab, the notification email, and the cards on the Monitor overview page.

Step 1: Check triggered alerts

1. You should still be in the Power Platform admin center from the previous lab. If not, sign in to the [Power Platform admin center](#) using your lab environment administrator credentials. Select **Monitor** > **Alerts** and then select the **Triggered alerts** tab.
2. Check whether any alerts have been triggered. Each triggered alert appears with its **Severity**, the **Product**, the number of resources **Affecting** it, when it was received, and the **Alert author**.

The screenshot shows the Power Platform admin center interface. In the left sidebar, the 'Monitor' section is expanded, and the 'Alerts' sub-section is selected. The main content area displays the 'Alerts' overview, with a tab for 'Triggered alerts' selected. Below the tabs is a table of triggered alerts.

Status	Alert rule	Scope	Product	Se...	M. ↓	Las...	Alert author
☐	Availability for high-use canvas apps is under 90%	Tenant	Power Apps	High	10:16 A...	Microsoft	
☐	Availability for high-use model-driven apps is under 90%	Tenant	Power Apps	High	10:16 A...	Microsoft	
☐	High-use cloud flows have a success rate under 90%	Tenant	Power Auto...	High	10:16 A...	Microsoft	
☐	High-use desktop flows have a success rate under 90%	Tenant	Power Auto...	High	10:16 A...	Microsoft	

Figure: Triggered alerts tab.

3. Select a triggered alert's name to open its details page. The header summarizes the alert — severity, scope, when it was received — and beneath it, the affected resources are listed with their current metric values, environment, and owner.

The screenshot shows the Power Platform admin center interface. In the left sidebar, the 'Monitor' section is expanded, and the 'Alerts' sub-section is selected. The main content area displays the 'Alerts' overview, with a tab for 'Triggered alerts' selected. Below the tabs is a table of triggered alerts.

Severity ↓	Name	Product	Affecting	Re...	Alert author
High	Availability for high-use canvas apps is under 90%	Power Apps	4	10:19 A...	Microsoft
High	High-use cloud flows have a success rate under 90%	Power Autom...	2	10:19 A...	Microsoft

An empty list means the rule ran and nothing crossed the threshold.

Step 2: Check the notification email

1. If your custom rule has triggered and you configured **Email** notifications, open your mailbox and look for an email from **PowerPlat-noreply@microsoft.com**.
2. Select **Go to alert** in the email to open the triggered alert view in the admin center.

Monitor > Triggered alerts > Availability for high-use canvas apps is under 90%

Availability for high-use canvas apps is under 90%
Alerts authored by Microsoft only target Items that are considered "high-use". These alerts are not editable. [Learn more](#)

Severity	Affecting	Scope	Received	Alert type	Alert author
High	2	Tenant	10:21 AM, 12/4/25	Power Apps	Microsoft

Flows 2

Name	App open success...	Product	Type	Environment	Managed	Owner
Accounts App	77.78%	Power Apps	Canvas app	Monitor Prod Demo (No ME)	No	Arjun Mayur
Inventory App	70.37%	Power Apps	Canvas app	Monitor Prod Demo (No ME)	No	Arjun Mayur

Figure: Alert notification email with the Go to alert button.

Step 3: Review the Monitor overview cards

1. Go back to **Monitor > Overview** and review the two **Alerts** cards:
 - **Triggered custom alerts** summarizes the rules you and other admins created, helping you focus on priority resources.
 - **Triggered alerts for high-use items** summarizes Microsoft's predefined alerts for your busiest resources.
2. If either card shows triggered alerts, select an item — for example, **High-use cloud flows have a success rate under 90%** — to open the list of affected resources and their metric trends. If both say "All clear!", no rule has been triggered.

Step 4: Review the predefined alert rules

1. Return to **Monitor > Alerts** and select the **Alert rules** tab. The predefined rules sit in the same list as your custom rule — the **Alert author** column shows **Microsoft** for them, and their **Scope** is **Tenant**. They cover availability and success rates for high-use canvas apps, model-driven apps, cloud flows, desktop flows, and agents.

Status	Alert rule	Scope	Product	Severity	Modified on	Last run	Alert author
☒	Cloud flows with more than 2 runs	Environment	Power Automate	Medium	2:01 PM, 7/2/26	Not Available	System Administrator
☒	Agents	Environment	Copilot Studio	Low	10:11 PM, 6/10/26	Not Available	System Administrator
☒	Copilot Studio	Environment	Copilot Studio	Low	8:09 PM, 5/6/26	Not Available	System Administrator
☒	Power Automate	Environment	Power Automate	High	11:53 PM, 4/27/26	Not Available	System Administrator
☐	Availability for high-use canvas apps is under 90%	Tenant	Power Apps	High	—	5:28 PM, 8/28/26	Microsoft
☐	Availability for high-use model-driven apps is under 90%	Tenant	Power Apps	High	—	5:28 PM, 8/28/26	Microsoft
☐	High-use cloud flows have a success rate under 90%	Tenant	Power Automate	High	—	5:28 PM, 8/28/26	Microsoft
☐	High-use desktop flows have a success rate under 90%	Tenant	Power Automate	High	—	5:28 PM, 8/28/26	Microsoft
☐	High-use agents have a success rate under 90%	Tenant	Copilot Studio	High	—	5:28 PM, 8/28/26	Microsoft
☐	Power Apps Launch equals 1	Environment	Power Apps	Medium	6:16 PM, 6/16/26	Not Available	System Administrator

Figure: Alert rules tab showing the Microsoft-authored predefined rules.

2. Select the ellipsis (...) next to one of them and choose **Details** to review its configuration — the metric, the 90% threshold, and the tenant-wide scope.

Alerts authored by Microsoft only target items that are considered “high-use,” and these alerts are not editable. They serve as a baseline safety net across your tenant; use custom alert rules, like the one you created, for more granular control over specific environments, resources, metrics, and thresholds.

At the time of writing, “high-use” has fixed thresholds: at least 100 recent launches for canvas and model-driven apps, 150 daily runs for cloud flows, 100 daily runs for desktop flows, and 200 recent sessions for agents. Unlike your custom rules, predefined alerts flag affected resources **regardless of whether they’re in a managed environment**, and they don’t send email notifications — the **Triggered alerts for high-use items** card on the Overview page is where their results surface, so check that page regularly.

Your metric is evaluated daily, a triggered alert appears in the Triggered alerts tab and in your inbox, and Microsoft’s predefined rules cover high-use resources you haven’t written rules for.

Congratulations! You completed the Inventory and Monitoring module. You now have a searchable inventory, repeatable queries, automated reporting, usage insight, and a monitoring system that notifies you when something needs attention.
