

Power Platform monitoring (Managed Operations) hands-on lab

Overview

This hands-on lab shows how to use the Power Platform admin center (PPAC) **Monitor** experience to check app health, diagnose issues, and set up proactive alerts for a production canvas app and its supporting cloud flow.

Estimated time

Approximately 15 minutes.

Objectives

- Open **Monitor** for an environment.
- Interpret key health metrics (success rate, load time).
- Use recommendations to identify root causes.
- Create a success-rate alert rule (preview).

Prerequisites

- Role: Power Platform admin, Power Platform Service Admin, Global Admin, or Environment System Administrator.
- Tenant-level analytics enabled.
- An environment (for example, `Your Name - Development`), preferably a Managed Environment.
- A canvas app named `Device Ordering App` (or similar) and a related cloud flow with recent runs (both successes and failures preferred).
- Modern browser (Microsoft Edge or Google Chrome recommended).

Step 1 : Open the Power Platform admin center

- 1 . Go to: <https://admin.powerplatform.microsoft.com>.
- 2 . Select **Monitor** from the left navigation. The overview screen shows primary metrics and outliers for your apps and flows. Note: These tiles may be empty if there has been no recent activity in the environment.

- 3 . Select **Power Apps** under the products heading.

Figure: Monitor and **Power Apps** menu selections.

- 4 . From the Canvas app view, click your app to drill into its metrics.

Step 2 : Review recommendations

- 1 . In the app detail view, find the Recommendations panel (appears with Managed Environment enabled).
- 2 . Typical recommendations include:
 - 1 . Launch failures caused by permission issues.
 - 2 . OnStart latency due to multiple sequential data calls.
- 3 . Note items that require remediation or follow-up.

Figure: Recommendations highlighting permission improvements.

Step 3 : Evaluate model-driven app dwell time

- 1 . Return to the **Monitor** app list and select **Model-driven apps**.

- 2 . Locate the row summary dwell time metric for the app you want to evaluate.
 - 1 . Row summary dwell time indicates how long users actively view the AI-generated record summary.
 - 2 . A higher value suggests users read the summary thoroughly; a very low value suggests they glance at it quickly or skip it.

Figure: Logs showing row summary dwell time for a model-driven app.

Step 4 : View app logs

- 1 . In **Monitor**, open **Logs** and click **Get error logs**.

Figure: Click path to access error logs.

- 2 . Select **Power Apps** from the product dropdown.
- 3 . Choose your App name, set the Metric to **App open success rate**, keep the time range (for example, 7 days), and click **Get error logs**.
- 4 . Review the timestamped log entries to identify common failure patterns and correlated errors.

Timestamp	User ID	Resource type	Resource sub ...	Attributes
9/22/2025, 6:30:14 AM	452197c3-03ca-...	PowerApps	CanvasApp	{"powerapps.client_state":"healthy","power
9/22/2025, 6:30:14 AM	452197c3-03ca-...	PowerApps	CanvasApp	{"powerapps.client_state":"healthy","power

Figure: Error log showing recent failures and details.

Step 5 : Inspect related cloud flows

- 1 . In **Monitor**, select **Power Automate** or the flows tab for the environment.
- 2 . Filter by the cloud flow that supports your canvas app and review recent run history.
 - 1 . Look for failed steps, long-running actions, and throttling errors.
 - 2 . Expand individual runs to see input/output and connector responses.
- 3 . If the flow shows frequent failures, open the cloud flow in the Power Automate portal and use run history and tracing to diagnose the root cause.

Step 6 : Create an alert rule (preview)

- 1 . In **Monitor**, click **Alert rule**.
- 2 . Configure the rule with values similar to:
 - Name: Success Rate <95%
 - Product: Power Apps
 - Product type: Model driven app
 - Scope: Environment
 - Environment: [Select your environment name]
 - Metric: App open success rate
 - Operator: Is Under; Value: 95 %
 - Severity: Medium
 - Notification Type: None Note: In practice you would want to include a notification, but it is being omitted for overview purposes in this lab.

New alert rule

Get actionable notifications that you can use to improve tenant health. Alerts are a feature of managed environments.

Alert rule name *

Success rate < 95%

Product *

Save

Cancel

Figure: Configuration for a new alert.

- 3 . Click **Save**, wait for the rule to be created, and verify the rule is **On**.
- 4 . Once the alert is created, alert conditions can be reviewed from the **Triggered Alerts** tab.

Summary

You completed these tasks:

- 1 . Identified a success-rate dip recommendations to find permission and performance issues
- 2 . Used
- 3 . Viewed error logs
- 4 . Created an alert rule for proactive monitoring

Tips

- 💡 Target $\geq 99\%$ success rate for critical apps.
- Reduce startup latency: consolidate queries, use `Concurrent()`, and cache static data where appropriate.
- Recommendations appear (or expand) in Managed Environments.
- Use maker-side **Monitor** and **Live Monitor** (in Power Apps Studio) for maker-level debugging.
- Revisit alert thresholds after a week to establish a baseline.
