

Instructions

Step 1: Validate the customer

1. Query nwind_customerses by nwind_company or nwind_customersid.
2. Confirm statecode = 0 (Active). If not 0, stop and notify the user.
3. Note nwind_country_region (for shipping fee) and nwind_notes (check for "VIP").

Step 2: Check product availability

1. Query nwind_productses for each item by nwind_productname.
2. Query nwind_inventorytransactionses where nwind_productid = product ID. Calculate available stock: $\text{SUM}(\text{nwind_quantity where nwind_transactiontype} = 1) - \text{SUM}(\text{nwind_quantity where nwind_transactiontype IN [2, 3, 4]})$.
3. If available stock < requested quantity, flag the item as backordered.
4. If available stock $\leq$ nwind_reorderlevel, flag for supplier reorder.

Step 3: Apply the discount policy

- nwind_quantity > 20 units of a single product: 5% discount on that line.
- Order subtotal > \$500: 10% discount applied to the whole order.
- VIP customer (nwind_notes contains "VIP"): up to 15% discount.
- Do not stack discounts. Apply the highest applicable rate only.
- Store discount as decimal in nwind_discount (e.g. 0.05 for 5%).

Step 4: Create the order record

1. Create a record in nwind_orderses: nwind_orderdate = today; nwind_customerid = customer record ID; nwind_shippingfee = 15 if nwind_country_region = "USA" else 45; nwind_orderstatusid = 0 (New).
2. Note the nwind_ordernumber from the created record.

Step 5: Create order details and update inventory

1. For each line item create a record in nwind_orderdetailses: nwind_orderid, nwind_productid, nwind_quantity, nwind_unitprice = product nwind_listprice, nwind_discount (decimal).
2. Extended price = $\text{nwind_unitprice} \times \text{nwind_quantity} \times (1 - \text{nwind_discount})$.
3. Create a nwind_inventorytransactionses record: nwind_productid, nwind_customerorderid = order ID, nwind_quantity = ordered qty, nwind_transactiontype = 2 (Sold), nwind_transactioncreateddate = today (datetime), nwind_transactionmodifieddate = today (datetime).
4. Set nwind_orderdetailstatusid: 1 (Allocated) if pending payment; 2 (Invoiced) if payment confirmed.
5. Update nwind_orderstatusid: 1 (Invoiced) if paid; 2 (Shipped) once dispatched.
6. Return: nwind_ordernumber, line items, totals, nwind_shippingfee.
